Chapter 1 : Introduction Chapter 2 : Toutes les Variétés de Neurons, avec leurs Représentations Chapter 3 : Formulation de la Theorie Chapter 4 : Un Neuron de La Prépondérance Des Sens Chapter 5 : Processus Synaptique De La Prépondérance Des Sens (conclusion) A new generation of 'neuro-fuzzy computing'(NFC) has been built for the past decade and a half. It is made of a fusion of fuzzy computing (FC), neuro-dynamic systems (NDS) and evolutionary computing (EC). Although NFC is maturing and gathering increasing interest, it has not yet reached critical mass. This is mainly due to the fact that the main tool, namely neural networks, cannot be used for making predictions because of their deterministic/non-deterministic nature. These problems are overcome by fuzzy computing, which is an extension of neural computing and has been introduced in the 1970s. However, its use is restricted to modeling, for which only simple methods exist. In contrast, NFC has been developed more recently, and has enabled scientists to tackle a large range of problems, including learning from past and future states, handling uncertainty, and making decisions. NFC is a computational paradigm that has attracted the attention of many researchers in the field of computer science and natural sciences. At the same time, it has aroused controversy, and especially with regard to the relations between theory and application. For example, the complexity of the problems tackled and the algorithms used in many cases may limit the usability of these tools. As a result, a number of applications have not yet been developed, and many questions still remain. What is the link between the NFC concepts and theories and the algorithms used to implement this approach? Which applications can be envisaged with this tool? This book aims to provide the reader with a comprehensive introduction to NFC, with a review of the mathematical concepts
