Biomechanical evaluation of the stability of the Walch ligament and calcaneo-cuboid joint capsule during simulated heel strike in walking: implications for the pathogenesis of heel pain. Heel pain can be caused by impingement on the calcaneo-cuboid joint or development of pressure within the joint. The purpose of this study was to investigate the in-vivo forces which exist within the joint and the tissues surrounding it during the heel strike phase of the gait cycle. Such data could prove useful in developing effective treatments for heel pain. This study evaluated the forces which exist within the calcaneo-cuboid joint during heel strike, and the forces which exist within the structures surrounding it. Using cadaveric calf specimens, joint forces were measured during heel strike using two orthopaedic implants. One implant was placed into the calcaneo-cuboid joint and one into the medial subtalar joint. Subsequently, a mixed-effects analysis of variance was performed to compare the forces during heel strike for various sample conditions. There was no difference in the force distribution patterns between the different sample conditions. The force applied at the calcaneo-cuboid joint was significantly lower than the force applied to the subtalar joint (P Q: Validating date in SQL Server I have a table with a date column which must be a valid date. The table can have null or an empty string for the date. How can I write a query to check that the date is valid
