When you wake up in the morning, you turn on your computer. The screen displays an operating system login screen to welcome you. You login using a user name and password. All your work and other applications that you have opened are still running. With a click of a mouse, you can close the applications and logout. That's it. The operating system is switching your computer off. But we can do better than that. There are a few tricks that you can use to extend the life of your computer and prevent it from running down. Extending the life of your laptop If you haven't got any performance issues with your laptop, you could just leave it on for a few hours every day. Your computer will run just fine, but the battery will drain rather quickly. How? Your computer uses power to run the processor and to keep the data on the hard drive and RAM up-to-date. When you don't use your laptop for a few hours, your processor and hard drive cool down. This means that they will use less power than they would if they were running all the time. If you want to prevent your computer from running down, just put your laptop on power save mode when you aren't using it. This will give your processor and your hard drive more time to power down. You can do this by pressing the power button, then hold down the shift key, until you see a small symbol with a clock and a power button. Extending the life of your PC You can extend the life of your PC for many more hours. This will extend the battery life, extend the running time of your computer and reduce the power consumption. How do you do it? Plug your mouse into one of the USB ports. Plug your computer speakers into your PC's sound card. Plug in a USB memory stick. This will extend the battery life. Extend the life of your keyboard and mouse If you have an external keyboard and mouse, you can extend the life of both devices by powering them off when not in use. Turn off the power to the keyboard and mouse when you aren't using them. Plug in the device when you need it. Extending the life of your laptop's hard drive If you have a 2.5in hard drive, you could remove the hard drive from your laptop and place it on a shelf. This will
