"Mellotron" plugin provides an emulation of the classic Mellotron, a.k.a. "tape machine". The Mellotron is a limited audio tape machine used for producing recorded "sheets" of music which are played back on a piano, in a stringed instrument (usually a guitar) or a harp. In a typical scenario, the instrument would be recorded in turn for each of the three "staves", with each staff containing a part for each of the three keys of the piano. The full piece was then recorded by playing through all three staves at once. The Mellotron was a relative of the earlier tape echo chamber. The tapes were often slowed down to nearly imperceptible speeds to produce a more lifelike sound, and the machine's console could be switched from the standard piano roll back to a slow-motion tape running at around 12 rpm to capture the subtle variations in sound in real time. Note: "Mellotron" is not an emulation of a specific Mellotron. It is a generic name for a "looped" tape recorder. Demo videos and example patches: What's this object called? A glass ball with a cup on top of it? What's this object called? A glass ball with a cup on top of it? I don't know its name. It's used to put a tea cup on it. A: It's called a teacup and saucer. A: It is also known as a mazarine cup or a highball. A: For some reason I can never figure out there are many different types of glasses and a teacup/saucer combination is known as a mazarine cup. There is also a highball glass that is also very similar. I've used the teacup and saucer version on several occasions and I love the mazarine cup. It is a very elegant way of serving a cup of tea with a small cup on top that still has the shape of a cup. Q: How can I set different css values for different ids? I'm trying to make a CSS website that changes the display mode of 80eaf3aba8

Morph The Morph DVS Guitar VST plugin brings amazing Vintage DVS Gratings in your DAW. Morph Groom is an additive process in DVS. It can be used on drums, vocals, guitar, bass and many other audio sources. The technique uses the warping of the waveform, based on the amount of time the audio is at a certain rate. Morph Groom is based on the ability to load up to 500 different Morph Grooms, to control their VST parameter and correct them using a Pitch Wheel. Description: Sliver 1 Description: Other Plugins There are also some interesting DVS plugins, especially for vocals: Sock Monkey: A metronome and warping effect DVS plugin for vocals. Predator: DVS effect that samples a Cello and makes an emulation of a Double-Bass VST and used as an add-on to DVS. DVS Synthesizers There are also some interesting synthesis plugins for vocals: Dynatron: DVS Synthesizer for vocals using an array of analog oscillators and filters, a VCA and 2 VCAs. DVS Drummer DVS Drummer is a virtual instrument designed to use the DVS technique to create a completely different Drum and Bass style. References Category: Virtual instruments A wide range of household and industrial cleaning products contain surfactants as cleaning agents. Detergents of widely varying types are used by the consumer, from conventional hard surface cleaners to laundry detergents. Depending on the type of surfactant they contain, detergents may be broadly classified into anionic, nonionic, cationic and amphoteric, which are described in detail in "Cationic Surfactant," Chapter 1.29 of "Nonionic Surfactants," Chapter 1.10 of "Anionic Surfactants," Chapter 3.1.1 of "Amphoteric Surfactants," Chapter 1.26 of "Nonionic Surfactants," Chapter 4.5 of "Cationic Surfactants," and Chapter 3.5 of "Anionic Surfactants" of "Cationic Surfactants," the entire contents of which are incorporated herein by reference. The DVS Guitar is a new guitar plugin synthesizer inspired by the original DVS work by Ross Bencina and Dave Smith. This is the second plugin and feature set to follow on from the successful DVS Guitar I. The DVS Guitar features include: - 16 delay channels, four chorus (reverb) channels and a flange (dynamics) channel - Phaser (LFO) effects - Modulation effects in the form of various ADSR envelopes with LFOs, gate, and harmonic modulation - Detailed stereo and mono bus architecture - Two voices per instrument with a total of five voices per patch The core sound engine of the DVS Guitar is based on a sampled acoustic guitar: each delay channel is a looped sample of an acoustic guitar played through a digital delay device. The result is a rich, authentic and reverberant echo of guitar playing with realistic tonal variations. Each delay channel is also split into two channels to emulate the stereo signal path of an acoustic guitar. The chorus (reverb) channels are also based on sampled acoustic guitar loops with dynamic effects, as well as stereo and mono bus architecture. Each of the patch controls is a manual modulation of the signal chain and can be split into two or more groups. Each group operates independently and has independent pan, channel mix, and volume controls. So, for example, a delay channel can have a fast, slow and dry group, and a chorus group can have a channel, reverb and flange group. The DVS Guitar is a perfect tool for the creation of different sounds and musical styles, all of which can be modulated in real time. Features: - A rich, acoustic sample based guitar engine - Multiple independent delay channels - Chorus (reverb) channels - Flange (dynamics) channel - Phaser effects - Modulation effects in the form of various ADSR envelopes with LFOs, gate, and harmonic modulation - Detailed stereo and mono bus architecture - Two voices per instrument with a total of five voices per patch - Stereo and mono sum mode - Two independent stereo and mono bus outputs - Velocity sensitive assignable modulation - Direct output of the synthesized signal (pre-assigned to loopout or loop-through) - Sampling rate of up to 512 khz DVS Guitar has been updated to VST 2.0.2 and 32-bit host and program VST (32 and 64-bit host/program required). Included in the main download is the Windows 32-bit and 64-bit version
