Light and electron microscopical study](#)]. Endoplasmic reticulum in Purkinje cell bodies was electron-microscopically demonstrated by means of the Kontaktron method. Our results, obtained by confocal laser microscopy, showed the presence of large rod-shaped bodies of endoplasmic reticulum in the cytoplasm of Purkinje cells. These bodies were found to be more common in the upper cell bodies than in the lower ones. Endoplasmic reticulum was also demonstrated in the neuropil of Purkinje cells, especially in the parallel fibers of their terminals. The influence of the anesthetic mixture on analgesia after surgical removal of impacted mandibular third molars. This prospective clinical study evaluated whether the choice of anesthetic mixture influences the postoperative analgesic effect after surgical removal of impacted mandibular third molars. Ninety ASA physical status I and II patients were randomized into 3 groups according to the type of anesthesia received. Group 1, a mixture of bupivacaine, fentanyl, and fluciclonide; Group 2, lidocaine with 1.5 mg/kg epinephrine and fentanyl; and Group 3, 0.25% bupivacaine with 1 mg/kg ep
