Applications, Features, and History Adobe Photoshop is one of the most powerful tools in the graphic arts and online industry. Adobe Photoshop is a software tool used in Adobe InDesign and Adobe Illustrator to apply a variety of graphic tools to images and documents, including layers, vector objects, text and even 3D objects. While it has many tools that assist the user in their creative process, it also has a variety of other tools that aid them with some of the most complicated tasks involving photos, such as scanning, layering, filtering, and correction. It even has tools to help process raw images which allow it to work on most all image file formats. Adobe Photoshop is often referred to as the Swiss Army knife of graphic design. Its powerful features and numerous applications that cover a wide range of design needs makes it very easy for the professional and non-professional alike to use. It is, in fact, so versatile that its manufacturer, Adobe Systems, claims that it is the second most-used application on the planet. Adobe Photoshop was first released in 1987 and is licensed exclusively to create, edit, and otherwise manipulate image files. A registered version of the software is protected by a serial number, like a lock on a door. The registration is required at the time of purchase. Once registered, the software can be used in a variety of ways, including creating vector files and manipulating raster images. Photoshop also includes several utilities, including a Disc creator, batch converter, image optimizer, and app generator. All of these functions have the potential to be useful and create more work for the designer or photographer. What Does Photoshop Do? When most people think of image editing, they think of removing unwanted parts of the image or making a person look smaller, larger, or smarter (larger nose, smaller nose, bigger head, smaller head, etc.). However, Photoshop can do a lot more than that. It has at least three modes of operation (by default): Image Mode: This mode allows the user to create, modify, and enhance images using all the tools and functions of the program. 27 November 2012 It's been a long time coming but soon I'll be able to update here with a brand new blog post - my last one (on a campaign that failed) has been updated and now available in the Library for Reference! As you can see, I've made some changes and gone back to using my previously used photo (in this case David Shepherd's great shot of the bald eagle) as well as taking off some of the distracting clutter I was putting in to the shot. The most important changes, however, are the addition of information and metadata tags (which I've written about on my blog) and the addition of some imagery to help students and educators identify this bird and more importantly learn about it. There are also some links to what I think are relevant websites in the drop down menu on the right of the slide. The project was created as part of my continued work to contribute to the Wikimedia Commons - in this case to the Commons:Osprey, the page for The Bald Eagle. While this was a great project to work on I never have come across many other images of this bird in the Library for Reference or anywhere else - which is a shame! This bird is not only really cool looking but also extremely important - as a top predator who works in the ecosystem, it is of vital importance to the health of the planet. In addition to being an amazing looking bird, it plays a key part in re-establishing balance in the world. So now you have an easy way of finding and adding images of the bald eagle to your own Wikimedia Commons library. There's always more to learn! If you want to read more about the project click here. I hope that you find it useful and interesting and that it gives you inspiration for your own projects! 18 November 2012 It's been a while since I have posted something on this blog but not because there has been nothing going on. While it has been a pretty much dormant blog it has been very useful for my own projects and as a result of the work it has inspired me to create a new blog which I am in the process of building. My book is now available as an eBook - yet another way of getting readers to open their books and start reading it. I have also added an Author Page where I have posted information about the book, upcoming events, my online presence and more - from here you can access the most up-to-date information on my work - I

There are currently around 12.5 million Android devices being used around the world. With an annual production of over 450 million, it seems that Android is poised to become the top mobile operating system for more than half a billion users in the not-so-distant future. According to a new report from the International Data Corporation, that is exactly where the numbers will land within five years. IDC predicts the Android platform will become the most used mobile operating system within five years, which means smartphone penetration will increase to 16.3% in 2019 from 12.5% in 2012. The report states that Apple, Google's Android license partner, is currently selling the most mobile devices each year, meaning that the platform would see significant growth by putting the total number of Android devices up to 46.2 million. The increase in Android devices would be an increase of 36.4%, which is the second-biggest growth rate among all of the top operating systems in the IDC report. "There is so much potential in Android that it deserves its own technology section in this report," IDC's senior vice president of Mobile Phone Launch Insights, Dr. Somasekar Ramadasan, said in a statement. "We have seen time and again that when Android devices fail to meet the demands of consumers and businesses, it can affect adoption rates. But, when they do hit the mark, we have seen Android users lead the way in adoption of new technology." With the increasing number of smartphones, the overall operating system market is on the rise. The overall number of mobile devices could increase to nearly 760 million in 2022, which is an increase of 73.5% in the IDC report. "It is clear that Android continues to dominate the smartphone market," IDC's Platform Landscape Analysis Director Srinivasan Keshaviah said in a statement. "And since it is based on open-source software, users will continue to have the freedom to shape how Android develops and the devices it runs on." There are more than 2.4 million businesses now using Android devices, which is a 3.4% increase in the number of mobile devices being used by businesses. The number of Android devices being used by businesses will increase to more than 6 million by 2019, which is a 44.4% increase. Last year, the number of smartphones in the U.S
