QMathParser is a simple math expression parser (evaluator). It can process strings containing mathematical expressions, and evaluate them. It uses the fast muParser library to evaluate the expressions. It's main feature is

the fact that the expressions are evaluated using a "quasi" C or C++ programming language, making expressions that look like math programming in C look very similar to math programming in C++. QMathParser Version History 1.1.0 The first release. QMathParser Features QMathParser is a math expression parser (evaluator). As of v1.1.0, it can process strings containing mathematical expressions. It can evaluate

expressions, and it is able to handle the basic operations. It can parse strings containing expressions and evaluate them. It can process multiple expressions, with and without operators. It has an object oriented design that makes the code clean and easy to maintain. It has some features that make expressions look very close to math programming in C or C++. The interface is simple, containing only a small amount of functions. The expression parser

uses the fast muParser library. QMathParser Quick example of evaluating expressions QMathParser Library Dependencies QMathParser can be used with the following system libraries, the latest version is shown: Qt4: 4.8.5 Qt5: 5.10.1 Qt Designer: 5.10.1 Qt C++: 5.10.1 QtCore: 5.10.1 QtGui: 5.10.1 QtMath: 5.10.1 QtNetwork: 5.10.1 Boost C++ Libraries: 1.59 MuParser Library: 3.0.3 Qt Designer Qt Designer is a high-

level GUI designer for creating graphical user interfaces in Qt. MuParser Library MuParser is a (lazy, non-recursive) parser for mathematical expressions. It's main features are speed and versatility. MuParser also has a list of math functions that can be used inside the parser expressions. MuParser Library is a simple math expression parser (evaluator) that can process strings containing mathematical expressions. It supports basic and

advanced operations,

QMathParser is a C++ math expression parser. QMathParser is also a math expression evaluator, that can also evaluate parsed expressions. QMathParser is capable of parsing math expressions similar to Maple, Mathematica, and Wolfram Alpha. QMathParser allows to create functions, write and save expressions, and run expressions

as command lines. For more information on QMathParser you can see the user manual. QMathParser license: QMathParser is freeware software, and there are no restrictions or copyrights to use or modify it. If you use it in a commercial application, please contact the author for the required authorization. QMathParser should be released under GNU General Public License or any other Free

Software license that is approved by the authors. QMathParser homepage: qmathparser-code-example.tar.gz: qmathparser-code-example.tar.gz is a self-extracting archive for Windows. Extracting qmathparser-code-example.tar.gz using WinRAR results in qmathparser-code-example.exe. qmathparser-code-example.exe should be run as an administrator, otherwise, it will not be able to modify the registry. I used qmathparser-code-example.exe to

test the installer. Running qmathparser-code-example.exe as an administrator was needed to install qmathparser-code-example. Installation guide (in English): Install procedure: 1.- Install the installer. 2.- Run the installer, it should install qmathparser-code-example.exe 3.- qmathparser-code-example.exe 4.- You should see something like the following: Welcome to QMathParser. You can use the following options to

start or stop the calculator. This will start the calculator and an instance of the calculator will be running in the background. Are you sure you want to perform this operation? Yes / No Current math expression is: math = 4+5*2*3+4 Start calculator: I pressed Yes. Cal 77a5ca646e

QMathParser Features: User friendly, light-weight math expression parser. Advanced operator set, thus for a wide range of uses. Fully compatible with muParser and other math-expression libraries, thus you can use any of them. Performs a simple evaluation of a mathematical expression as given by the user, including some basic calculations (min, max, sum,

etc.). Extensive support of functions, including basic trigonometry, exp, log, factorial, as well as many others. QMathParser Statistics: Language: C++ Usage: QMathParser is a standalone application, so it's available for all operating systems and for all platforms. License: GNU LGPL v2.1 QMathParser is open source software. You are free to copy, modify, distribute and use QMathParser, under the terms of

the GNU Lesser General Public License (LGPL) version 2.1. QMathParser is a free software distributed under the GNU Lesser General Public License (LGPL). The source code is freely available under the LGPL version 2.1 and is the first step to its full open-source. QMathParser gives you the possibility to manipulate expressions in mathematical form. You can use QMathParser to process math expression that are not able to be processed by

any other math library, such as regular expressions, to perform basic calculations or to manage data structures. You can add, search, evaluate or test math expressions and easily visualize them to see how they are processed. The objective of the project is to provide you with a flexible math expression parser and to make it available for all operating systems, for all platforms. Supported file types: There is no limitation to the file

format, you can use any expression that you want to evaluate with QMathParser. The QMathParser project will use many math operations and functions. You can check a complete list of supported operations here. Compatibility: QMathParser supports all the math operations in muParser. QMathParser supports all the math operations in other existing math expressions libraries, such as muParser or lrmath.

QMathParser does not support strings and multiline expressions. The internal format of the file doesn't support that. QMathParser does not support regular expressions, therefore cannot

What's New In?

This program is an easy to use math expression evaluator. It is written in C++ with a GUI that allows the user to visually see the math expression and the

intermediate results. The result is then displayed in text format. Inputs and Outputs: QMathParser accepts math expression input in string form as a command line argument. It produces an output in the form of string. It accepts most of the basic mathematical operators and functions, however, it also includes more complex operators, such as function results (vector notation), Fourier Transform, for example. It is capable of evaluating expressions

and even performing calculations on matrices. Features: QMathParser is a fast math expression parser, which means that the faster the input, the faster the output. It is written in C++ with a GUI that allows the user to visually see the math expression and the intermediate results. It also has the following features: Built-in interactive calculator: It allows the user to input math expressions and perform calculations. Built-in function

library: It contains a list of math functions that the user can perform calculations using. Built-in mathematical operators: QMathParser allows you to use operators such as +, -, *, /, and so on. Built-in simple functions: QMathParser includes functions such as abs, cos, sin, pi, ceil, floor, exp, log, log10, floor, exp2, factorial, sqrt, cosine, trig, etc. Built-in complex functions: QMathParser includes functions such as abs, acos, atan, arg, asin,

atan2, ceil, cos, exp, factorial, floor, exp2, ln, ln10, pi, tan, trig, etc. Built-in complex functions (complex): QMathParser includes functions such as abs, acos, atan, arg, asin, atan2, ceil, cos, exp, factorial, floor, exp2, ln, ln10, pi, tan, trig, etc. It is also capable of evaluating expressions and even performing calculations on matrices.
